

Wall Mount/Split System Bag

This cleaning bag is designed for use on wall mounted split systems.

This bag comes in Standard and Mini with a 25mm BSP threaded drain fitting to suit most hose adaptors

Using the Wall Mounted Split System Cleaning Bag

Step 1

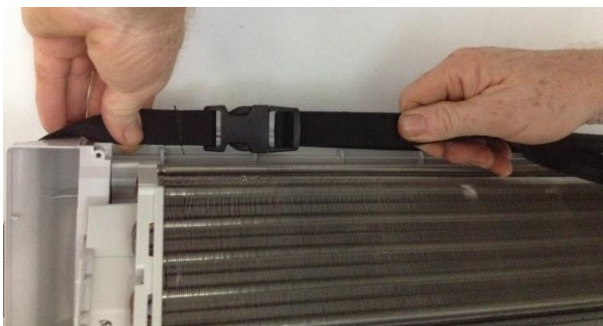

Always isolate all power to your split system prior to any work.

Step 2

Remove the front fascia from the wall mounted split system and clean.

Step 3

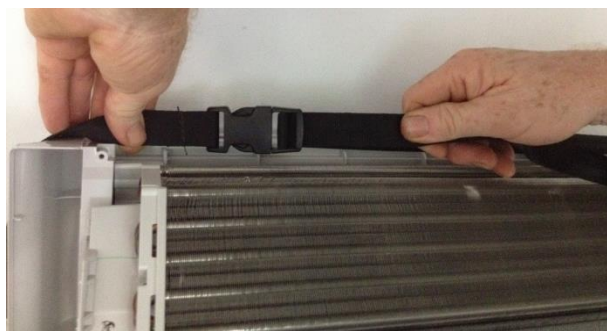

Place the strapping over the exposed evaporator coil.

Step 4

Spend time setting up the back panel under the edge of the split system mounting frame. This will determine the dryness of your wall when finished.

Step 5

Adjust the strap to hold the bag in position.

Step 6

Connect drain hose from the cleaning bag outlet to a 20 litre drum or container for waste water.

Step 7

Cover the electrics with a plastic cover for protection. You can now pressure clean both the coil and drum fan.

(NOTE: Do not allow the drum fan to spin whilst cleaning)

Step 8

Use a wet/dry vacuum cleaner to remove the excess water from the fan and evaporator coil.

Step 9

Remove the cleaning bag and fit the cleaned front fascia back on to the split system.

Step 10

Turn the power back on and the process is complete.
